Frequently Asked Questions about COVID-19

What’s a coronavirus?

Coronaviruses are a large family of viruses that are common in many different species of animals, including camels, cattle, cats, and bats. Rarely, animal coronaviruses can infect people and then spread between people such as with MERS and SARS. It's important to know that there are coronaviruses other than COVID-19 that are circulating routinely.

How is COVID-19 being spread?
Past history with coronavirus tells us that spread to close contacts (approximately 6 feet) usually occurs via respiratory droplets (when a person sneezes or coughs). Most of the time, people spread this virus when they are symptomatic. But there is evidence of at least some spread occurring from people that are not having symptoms.

What are the symptoms of COVID-19?

Fever, cough, and shortness of breath are the most common symptoms. Confirmed cases have ranged from very mild or no symptoms to severe or life-threatening symptoms. CDC believes that people develop symptoms between 2-14 days after catching the virus.

What can I do to keep from getting it?

Everyday precautions are the best way to prevent contact with the virus.

- Regular hand washing with soap and water for at least 20 seconds.
- Avoid touching your eyes, nose, and mouth with unwashed hands.
- Avoid close contact with people who are sick.
- Stay home when you are sick.
- Cover your cough or sneeze with a tissue, then throw the tissue in the trash.
- Clean and disinfect frequently touched objects and surfaces.
